Mine ESP™
Submersible Borehole and Surface Pumps

RELIABLE WATER MANAGEMENT
FOR MINING OPERATIONS
Submersible Borehole and Surface Pumps for Mining Operations

HIGH EFFICIENCY DEWATERING SYSTEMS

Mining operations depend on reliable dewatering. You can rely on MineESP™ submersible borehole and surface pumps from Summit ESP®. We have the expertise, technology, and service excellence needed to control groundwater inflows and outperform all other solutions.

Any downtime in the dewatering system quickly leads to water accumulation within the mine and work stoppage. Water is an integral part of mining operations, but it often gets in the way and removing it can be difficult. Extraction operations often move around within the mine to maximize mineral yield, and as a result, dewatering must also be agile. Water volume and pressure fluctuates and dewatering must adjust to meet demand and deliver continuous service. Wells designed to lower the groundwater level and limit inflow must be both efficient and effective over time.

Our electric submersible pump (ESP) technology is field-proven to withstand thermal cycling, scaling, abrasion, and corrosion in the most challenging environments. Our horizontal pumping systems (HPS) also effectively dewater deep open pits, decline mines, and shaft underground mines.

Mine dewatering strategies often include a mixture of pumping technologies for different locations throughout the mine. In underground decline and shaft mines, HPS typically replace positive displacement pumps, split-case centrifugal pumps, and piston/plunger type pumps.

Benefits
- Reduced downtime due to inflow
- Low operating and maintenance costs
- Improved mine productivity
- Short lead times on new and replacement equipment
- Variable speed control to adjust to changing conditions
- Remote monitoring for fast response and problem aversion
- Better safety and stability

UNPARALLELED SERVICE

Top performance requires great technology plus an unwavering commitment to customer service. We combine best-in-class product performance and service excellence to deliver a level of service that sets Halliburton apart.

While many pump providers focus on product line management, Halliburton's Artificial Lift team has a different approach. We focus on customers and their needs, first and foremost, and hold ourselves to a higher standard, especially when it comes to customer service in today's energy industry.
Top Tier Technology
Our MineESP surface and submersible pumping systems directly address the hardest problems in moving geofluids to the surface—thermal cycling and scale resistance.

We use heat-resistant materials to protect pumps, motors, and other components from high temperature and thermal shock. Patented locking mechanisms within the pumps further protect bearings from excessive heat. Our DuraHard® coatings protect equipment from calcium carbonate scaling, as well as abrasives and corrosives, and our molecular bond coating provides hardness comparable to carbide materials with added ductility. In addition, our spiral grooves and specialized materials make our bearings and bushings particularly resistant to scale.

**ELECTRIC SUBMERSIBLE PUMP TECHNOLOGY**

**Corsair™ Motor**

A. High-temperature tape-in pothead for maximum reliability and performance
B. Compliant mount, tungsten carbide radial supports in the head and base to help reduce vibration
C. Mechanical bearing retainers incorporated into Big Foot™ bearings allow movement of rotor stack within stator during thermal cycling
D. Non-recessed rotors reduce bearing temperature, leading to significant increase in reliability and efficiency
E. High-temperature insulation system allow successful operation in high-temperature wells

**Defender® Seal**

A. Shaped rotor bars >> New design utilizes shaped rotor bars, resulting in less current waste and a more efficient motor.
B. Flat-top rotors >> Incorporate thermal insulated washers and eliminates the need for inserting motor bearings into recessed areas – thus reducing friction and heat while improving reliability and performance.
C. Self-aligning, wide-profile, Big Foot™ bearings >> Larger wide-profile bearing increases heat transfer, reducing internal motor temperatures. Large wide-profile motor bearing also distributes side loads over larger areas, thus reducing fretting damage in the stator laminations.
D. Standard double-wrapped polyimide insulated windings >> This feature provides added protection that improves reliability.
E. Precision hand-wound stators >> These stators allow more room in the slot for additional copper wire, thus increasing efficiencies and performance. Hand-winding also reduces the potential for damaging wire during construction, further increasing reliability and performance.

**Tiger Shark® Pump**

A. Super sand head eliminates scale deposition
B. Tungsten carbide radial bearings provide longevity
C. Extended expansion capacity to cope with thermal cycling
D. Extreme load thrust bearing helps prevent overload during system upset
E. Enhanced tungsten carbide material throughout pump
F. Grooved bushings help prevent scale deposition
G. Stage coatings help prevent CaCO₃ scale and NORM scale sticking
H. Patented Erosion Buster® design in every diffuser prevents abrasive recirculation within the pump
I. Special retaining ring provide secondary press-fit bushing retention to prevent bushing from spinning due to scale deposition or thermal cycling
J. Double-sleeve system provide more support to critical shaft end

**MineESP™ Submersible Borehole and Surface Pumps**

Our pumps stages include DuraHard® coatings to help prevent CaCO₃ scale and NORM scale sticking to ensure the longest life span possible.
