Summit ESP®
Products and Services

RELIABLE, DURABLE, AND EFFICIENT
ELECTRIC SUBMERSIBLE PUMPING AND
HORIZONTAL PUMPING SYSTEM TECHNOLOGY
We provide integrated electric submersible pumping (ESP) systems and horizontal pumping system (HPS) solutions to enhance daily well production and total reservoir recovery. Our commitment to providing superior technology and exemplary customer service raises the standards of the artificial lift industry.

**Features**
- Patent-pending hydraulic designs
- Extended system flow range
- Improved head curve lift to shut off point
- Lower hydraulic thrust
- Heavier wall construction in pump components

**Benefits**
- Higher standard in pump hydraulics with innovative design concepts
- Adapts to changing well production
- Improves gas handling, increases well drawdown, and improves ultimate reserve recovery
- Improves uptime by keeping gas in solution
- Extends operating range
- Extends pump run life

**Applications**
- Conventional oil fields
- Unconventional oil and gas fields
- Vertical, Horizontal or deviated wells
- Abrasive wells
- Horizontal pumping system (HPS)

**Plus**
- Flanged sleeve sand exclusion technology for rapidly declining, abrasive wells
- Erosion Buster® patented design increases run life in abrasive environments
- Wide-vane technology for gas lock prevention

The popular and dependable Tiger Shark® pump line is now even more reliable with the addition of the Tiger Shark® II (TS2) pump.

**Tiger Shark® II Advanced Extended-Range Pumps**

**DESIGNED FOR MAXIMUM FLEXIBILITY IN UNCONVENTIONAL, ABRASIVE, GASSY WELLS**

Summit ESP® – A Halliburton Service has designed and developed the optimum pump line for producing and developing unconventional resource plays. The Tiger Shark® II XRange™ pump line offers an industry-leading, extended operating range with capabilities to produce volumes from lower than 25 barrels per day and increasing up to 64,000 barrels per day.
Tiger Shark® II PUMPS: THE BEST CHOICE FOR HARSH ENVIRONMENTS

Gas, corrosives, abrasives, and heat are ongoing challenges to attaining long ESP run life. The superior Tiger Shark® II (TS2) pump design is targeted to increase run life and extend operating range in extreme environments. Technical enhancements have resulted in optimal pump performance in gassy, corrosive, abrasive, and high-temperature wells.

Cutting-edge ESP technology coupled with gold-standard service and basin-specific application expertise widens the performance gap to our closest competitors.

Cutting-edge ESP technology coupled with gold-standard service and basin-specific application expertise widens the performance gap to our closest competitors.
TIGER SHARK® X RANGE® PUMP STAGES

Maximum Flexibility and Range
Tiger Shark® X Range® (XR) pump stages incorporate innovative hydraulic design concepts with wide mixed-flow vanes and greater operating ranges, designed specifically to handle broader drawdowns of conventional wells and rapidly declining, sandy, and gassy wells typical of today’s dynamic unconventional vertical and horizontal drilled shale plays across North America.

X Range® Extended Range (XR)
Tiger Shark XR pump stages incorporate an abrasion-resistant bearing insert design that absorbs downthrust produced by the stages in the pump rather than the seal. The XR design eliminates the need for compression pumps that require time-consuming and precise field shimming. Imprecise shimming can potentially lead to short run times due to human error because each connection requires accurately measured, calculated, and performed shimming.

Extreme-Flow Applications
Tiger Shark XR 320 pump stages have a low-end operating range of less than 45* barrels per day and a high-end operating range of 420 barrels per day. The Tiger Shark XR 900 pump stages have a low-end operating range of 200* barrels per day while offering a high-end operating range of 1,650 barrels per day. These broad and efficient operating ranges allow the operator to maintain maximum production without the high costs associated with system changeouts and nonproductive time as the well productivity declines.

System Approach
A system properly designed by experienced Summit ESP application engineers can accommodate changing conditions during the life of the well, possibly eliminating the switchover to rod lift as the rate falls below legacy electrical submersible pump applications. Tiger Shark pump extended-range gas handling (XRGH) can run in conjunction with XR pumps and Liberator™ gas separators. The gas handling pump stages with hydraulic vane configurations can accommodate up to 60 percent free gas. Adding Corsair™ motors allows the operator to expect and receive increased run times through reduced vibration, improved sealing, and better dielectric strength.

Liberator™ Vortex Gas Separator

HELP REDUCE UNNECESSARY SHUTDOWNS CAUSED BY GAS INTERFERENCE

Overview
Summit ESP® – A Halliburton Service offers a high-performance suite of vortex gas separators designed to mitigate the downtime and other impacts of free gas excessive ingestion into electric submersible pumps (ESPs) during oil and gas production.

Summit ESP Liberator™ vortex gas separators are available in the 338, 400, and 513 series. Our highly efficient and advanced line of vortex separators is designed to allow continuous operation of the ESP system in the most extreme gaseous applications, effectively reducing the unnecessary shutdowns caused by gas interference in the pump.

Summit ESP vortex technology is standard in all three series, thereby avoiding the documented design flaws of “rotary separators” that have reliability issues when operating in abrasive applications. To further enhance reliability, our standard offering includes corrosion-resistant metallurgy and abrasion-resistant (AR) bearings. Our AR bearings are constructed with robust tungsten carbide, and provide radial support to extend operational life in severe-service well conditions.

In applications where a single separator is unable to handle the volume of free gas, either tandem separators and/or net positive suction head (NPSH) pumps are available for both the 400 and 500 series. Standard to our NPSH pump line are tungsten carbide bearings at the flange connections, along with optional thrust bearing support throughout the pump assembly.

System Benefits
» Eliminates gas locking for improved uptime
» Maximizes drawdown with improved gas management
» Enhanced design with reduced failure points for improved reliability and performance

* Consult your Summit ESP Representative for low-flow and high-gas applications.
Defender® Seals

ADVANCED SEAL EXTENDS ESP OPERATIONAL LIFE

Summit ESP® – A Halliburton Service has developed the Defender® super sand seal to operate in extreme downhole environments. Configured for each application, the Defender seal is designed to extend the operational life of electric submersible pump (ESP) systems with extreme redundancy and a patented design that prevents wellbore abrasives from damaging the seal and motor sections.

The tool’s sealing mechanisms are designed to extend the operational life of ESP systems by equalizing downhole pressure and preventing the intrusion of damaging wellbore fluids. Configurations for Summit ESP seals can be customized for service in extreme downhole environments.

In our standard ESP systems, the seal section is located between the intake and motor, where its principal functions are to protect the motor and support the downward thrust generated by the pump. The seal is equipped with a shaft-mounted thrust runner that transfers downthrust forces from the pump shaft to a heavy-duty thrust bearing that is fixed to the housing. The positioning of this bearing allows Summit ESP pumps to be run in tandem configurations without the need for integrated thrust-handling capabilities.

In a typical installation, an ESP system is submerged in fluid and lowered often several thousand feet into the wellbore. As well fluid enters the wellbore, the fluid column above the ESP increases, generating a pressure differential between the motor oil and the fluid in the annulus. Summit ESP seal sections equalize the pressures while preventing motor damage by blocking the invasion of wellbore fluids. Furthermore, Summit ESP seals are designed to handle the thermal expansion of motor oil during regular operation of the pumping system.

Features

- Automatic sand flush head design
- Protected pressure relief design
- Customizable bag configurations
- Single or tandem configurations
- Modified for high horsepower and extreme conditions
- Enhanced high-load (EHL) bearing

Benefits

- Upthrust bearing requires no locking ring, spacer or shims, and allows shaft movement to be set with high accuracy
- Exit ports prevent the swirling effect of abrasives, which destroys shaft seals and radial bearings
- Reduces downtime
- Mitigates issues with thermal expansion of motor oil
- Must be sized to match the well production handling capabilities.

Defender® Seals Significantly Reduce Operator’s Costs

These charts illustrate that the deployment of the Defender® super sand seal avoided significant cost for the operator over a 24-month period.

Seal section chambers are installed as either labyrinth or bag configurations. Labyrinth configurations permit well fluid to enter a chamber through a top-mounted vent port, thereby allowing pressures to equalize. The well fluid, which typically is heavier than motor oil, migrates to the bottom of the chamber where it is isolated from the next chamber, by virtue of a breather seal and pump to entering pump. Pressure equilibrium, but the bag section allows the motor oil to float between chambers.

Bag seals use a flexible elastomer bag contained within the seal housing to segregate and protect the motor oil from well fluid. As with a labyrinth seal, wellbore fluid is allowed to enter the housing through a vent port to create pressure equilibrium, but the bag acts as a flexible barrier to prevent contamination of the motor oil. Generally, both style chambers may be used in vertical applications, and bag seals are used when the pump must be set in a wellbore with a horizontal deviation of more than 45°. In high-horsepower applications or those with extreme reliability concerns, Summit ESP seals can be run in tandem configurations.

消耗品
- USD 85/bbl and USD 4/Mcf used to calculate deferred production value

图表显示了Defender®超级砂封的应用避免了操作者在24个月内发生的巨额成本。

密封段的隔室安装为 labyrinth 或袋式配置。 labyrinth 配置允许井液通过顶部安装的通风口进入隔室，从而允许压力平衡。 井液，通常比电机油重，会在隔室的底部迁移，由透镜和泵入口进入。 压力平衡，但袋式隔室允许电机油浮在隔室之间。

袋密封使用柔性弹性体袋包含在密封器的隔室中，以隔离开并保护电机油免受井液的侵害。 与 labyrinth 封隔器一样，井筒流体被允许进入隔室中的 housing 通过一个通风口来创建压力平衡，但袋起一个柔性的屏障来防止电机油的污染。 一般来说，两种隔室都可用于垂直应用，而袋密封则用于当泵必须在与45°以上的水平偏差的井筒中时。 在高马达功率应用或具有极端可靠性担忧的井筒中，Summit ESP密封可以在隔室中设置。
Corsair™ Motors

SURPASSING INDUSTRY STANDARDS IN CONSTRUCTION AND PERFORMANCE

Summit ESP® – A Halliburton Service offers the new standard in electric submersible motors. Corsair™ motors provide the operator with the highest levels of performance in the harshest downhole environments. The Summit ESP Corsair motor matches the construction of what the industry has called premium motors.

The Summit ESP Corsair motor can be upgraded to include compliant tungsten carbide bearings and a patent-pending insulation that combines polyimide insulation with PEEK, providing the best of both worlds by combining the dielectric strength of polyimide and the temperature rating of PEEK.

Triton® Gauges

THE NEXT GENERATION OF DOWNHOLE GAUGES

Summit ESP® – A Halliburton Service proudly presents the next generation of downhole gauges with leading-edge technology that provides superior asset surveillance capability, protection, and data acquisition. Triton® 7 channel (T7-125 or T7-150) or Triton 8 channel (T8-150) downhole gauges can be used with a variety of electric submersible pump (ESP) motors by using specially designed bolt-on gauge heads.

Triton downhole gauges are easy to install, easy to operate, and use a water-proof wye point connection. Telemetry to the surface is accomplished by superimposing DC signals on a traditional 5-KV ESP power cable. At the surface, these signals are translated into usable data that is displayed on the advanced technology Summit ESP ACS®-15 variable-speed drive (VSD) interface or Triton surface readout (TSR) unit.

No need to operate “blind” when critical “real-time” data can be acquired using Triton downhole gauges. The acquired data can then be transmitted via Modbus protocol or SCADA to a surveillance center through the Summit ESP Well Monitoring and Surveillance service. Analysis can then be performed by our team of petroleum engineers to ensure continuous operation and optimized production. This helps increase run life and reduce OPEX.

Reservoir life cycles can be improved by using Triton downhole gauges, in conjunction with proactive data evaluation philosophies, to prevent or reduce formation damage caused by overproduction. Triton gauges can provide data on water or gas breakthrough by monitoring intake fluid temperature and pressure.

Hercules™ Horizontal Pumping System

VERSATILE HORIZONTAL SURFACE PUMPING SYSTEMS FOR CONVENTIONAL OR UNCONVENTIONAL PLAYS

Summit ESP® – A Halliburton Service offers a horizontal surface pumping system as an efficient alternative to positive-displacement, split-case, and other surface pumping options. The system design is based on proven electric submersible pumps (ESPs) already in use in thousands of downhole applications. The multistage centrifugal pump is mounted securely on a modular skid, powered by a two-pole motor, and protected by a robust thrust chamber.

Applications
» Produced salt water disposal (ISWD) and injection
» Crude oil transfer/boosting
» Liquid CO₂ boosting/injection
» Lean amine pumping (gas treating)
» NGL/light hydrocarbon, crude oil pipeline booster
» Cavern storage/salt dome leaching
» Boiler/steam-generator-feed pumps
» Jet pump – power fluid pumps
» Lease automatic custody transfer (LACT) booster
» Mine dewatering

Benefits
» Lower initial operating and maintenance costs
» Modular design with short lead times on new and replacement equipment
» Flexible designs from 800 BPD to 70,000 BPD (23 USgpm to 2,000 USgpm)
» Back pull-out thrust chamber
» A single low-pressure mechanical seal
» Minimal noise and vibration; pulse-free flow
» Health, safety, and environment (HSE) friendly

Summit ESP® Close-Coupled (SCC) Surface Pump

For applications of 20 hp to 350 hp, the SCC surface pump uses the motor bearings to absorb pump thrust and is ideal for smaller water injection, amine, crude oil transfer, or LACT applications.
A. Heavy-Duty Skid
- Modular skid, designed using extensive finite element analysis (FEA)
- Hoist mounting points to simplify installation

B. Motor
- Power units available from 20 hp to 2,500 hp (15 kW to 2,000 kW)
- Electric motor options include TEFC, WPII, TEAAC, with area classification Class I Div II; other options available
- Diesel, natural gas engine, steam or gas turbine

C. Balanced Spacer Coupling
- Maintenance free and helps reduce vibration
- Facilitates quick mechanical seal replacement without breaking pump or piping connections

D. Thrust Chamber
- Designed for increased reliability, seal support, and access
- Back pull-out for quick seal changeout
- Seal failure will not contaminate thrust chamber
- Minimal routine maintenance required

E. Mechanical Seal
- Single seal assembly, exposed only to intake pressure
- Available in component or various cartridge seal designs
- API 682 and all applicable API flush and quench plans to meet customer and application requirements

F. Intake and Suction Flange (not shown)
- 316SS ANSI raised face flange is standard; other materials and types are available up to 3,000 psi (207 bar)
- Intake can be rotated in 90° increments to accommodate suction pipework

G. Pump
- Flow range of pumps covers 800 BPD to 70,000 BPD (23 USgpm to 2,000 USgpm)
- Discharge pressures up to 7,100 psi (500 bar)
- Mixed-flow stage design for reduced abrasive wear, optimal efficiency, and head per stage
- Ni-Resist iron is standard stage material; other materials available upon request
- Tungsten carbide or GRAPHALLOY® bearings are available for wear resistance or low-lubricity fluids, respectively
- Tiger Shark® pump option to reduce pump thrust

H. Discharge Flange
- Lap-joint type, comprising 316SS wetted parts and CS flange, compatible with ANSI standards
- Available in raised face or RTJ classes up to 5,500 psi (380 bar)
- API flange options available for higher pressures

I. Instrumentation
- Standard offering is intake and discharge pressure transmitter and vibration switch
- Skid-mounted junction box is available to provide single-point wiring
- Available in standard and explosion-proof enclosures, and customizable to suit customer or application requirements

Whether your application is upstream/midstream (using produced water injection, CO₂ injection, or crude oil transfer) or downstream (using natural gas liquids or amine for gas sweetening), we have the right solution for your needs.

GRAPHALLOY® is a registered trademark of Graphite Metallizing Corporation
Well Surveillance and Monitoring Service

ANALYZE AND UNDERSTAND WELL CONDITIONS

Summit ESP® – A Halliburton Service uses a holistic approach to well surveillance. Backed with 24/7 monitoring services, this approach increases production, improves run life, and reduces downtime and labor. Monitoring is a key part of increasing production and extending run life. Maximizing run life requires flawless execution during every part of the electric submersible pump (ESP) run cycle.

Operational Benefits

Real-time well surveillance increases the return on investment of an ESP system and the multimillion-dollar investment in the well’s production potential. Without the use of a monitoring system, optimizing an ESP can require extensive labor and onsite field service. Operators are forced to send field personnel to the wellsite to collect performance data and restart wells after nuisance shutdowns due to set points that quickly become irrelevant as well conditions change.

The Summit ESP well surveillance service eliminates the need for manual interventions. Set points can be adjusted without the need to send field personnel out to location. Operators are able to specify acceptable operating ranges via a remote computer or mobile device. If an operating parameter drifts outside of the specified range, the operators are automatically alerted through text messages, phone calls, or emails. This alert system allows for rapid intervention without the added expense and delays associated with dispatching field personnel to remote well locations where cell phones may not function.

Our full-service intensive monitoring platform arms analysts with all set points and logs, enabling them to act quickly and accurately in real time.

Flexible Systems

The well surveillance platform supports multiple SCADA systems that store key operating parameters in a centralized database for remote monitoring, analysis, and control.

Our proprietary web-based field service ticketing, dispatch, and applications engineering system gives our monitoring group a complete 360° view of each well’s equipment and operations.

The SCADA systems track and plot key parameters in real time, including motor current, variable-frequency drive (VFD), winding temperature, and pump intake pressure into an interface that has been optimized for readability. Operators and Summit ESP service professionals closely monitor trends and either remotely make any necessary adjustments or notify field personnel.

Optimize Performance

A team of degreed petroleum engineers continuously monitors wells on a 24/7 basis from our state-of-the-art monitoring center. For every newly installed system, our engineers configure personalized alerts that automatically notify field personnel and engineers of any problems. Each time a well is surveyed, our engineers reassess alerts to minimize nuisance alarms and optimize performance.

Using proprietary web-based applications engineering software, surveillance engineers mathematically model the operating conditions of downhole equipment and the inflow characteristics unique to each well, allowing them to fine-tune operating conditions, maximize production, reduce operating costs, and extend run life.

Many operators hold regular weekly meetings with Summit ESP surveillance engineers and regional personnel, where they are presented with an overview of their wells’ performance. These meetings allow operators to work together with diverse ESP experts to get the most out of their operations. Our surveillance engineers often also assist in monitoring wells on an operator’s in-house SCADA well management systems.

Effective applications are designed by incorporating lessons learned from operations, real-time monitoring, field optimizations, and the results of root cause analysis from previous runs.
Summit ESP ACS®-15 Active-Front-End, Drives

OPTIMIZE PERFORMANCE OF ESP OR HPS EQUIPMENT

Summit ESP® – A Halliburton Service presents the Summit ESP Adaptive Control System® (Summit ESP ACS®-15), the newest generation of variable-speed drives (VSDs) featuring proven technology to ensure ultimate performance for your electric submersible pumping (ESP) or horizontal pumping system (HPS) equipment. With their rugged outdoor rated design, proprietary software, and plug-and-play capabilities, the Summit ESP ACS-15 active-front-end (AFE) drives offer reliability, flexibility, accuracy, and multilevel protection. The Summit View™ color touchscreen operator interface enables user-friendly operation.

The family of Summit ESP ACS-15 AFE VSDs is the ideal choice whenever input power quality needs to be maintained or when power provider constraints arise. Phase shift transformers or passive input filters are unnecessary, thus reducing installation footprint requirements.

The Summit ESP ACS-15 AFE system’s robust design provides assurance for harsh-environment operations in all climates. State-of-the-art circuit boards feature a conformal coating, and all drive components reside in enclosures with cam-locking perimeter latches. This ensures doors seal integrity and ingress protection from unwanted contaminants.

Summit ESP ACS-15 AFE drives perform active harmonic cancellation. These drives, which are always IEEE-519 compliant under normal operating conditions, provide a power factor (PF) of .99 to unity (1.0) compared to other topologies that provide PFs of .95 to .98. Summit ESP’s AFE drives are not influenced by changes in harmonic spectrum, system impedance imbalances, or typical voltage variations.

Improve Power Cost

Power costs are usually the largest expenditure for an oil-producing field. Summit ESP ACS®-15 AFE drives offer several operational benefits, depending upon the characteristics of your field’s electrical distribution system.

These benefits include:
- Less kilowatt (kW) consumption
- Lower fuel-factor costs
- No PF penalties
- Fewer power system losses
- Additional power system capacity
- Cooler operating equipment

Use of the Summit ESP ACS-15 AFE drives provides:
- Lower electrical system losses
- Better voltage levels
- Cooler operation
- Extended run life

Summit ESP ACS-15 AFE drives offer:
- High power factors
- Increased system efficiency
- Possible elimination of PF penalties

The waveform snapshots shown below demonstrate how ACS-15 AFE VSDs provide significantly improved voltage and current sinusoidal waveforms compared to other drive topologies. As waveforms become more sine wave shaped, harmonic content declines and fewer harmonics are reflected into the power grid. Operating power costs are greatly influenced by the amount of input harmonics resident on the system.
DuraHard® Coatings

DuraHard® 3 Coating
Basic Reduced Friction and Corrosion Resistance
Summit ESP® — A Halliburton Service offers a patented multilayer slick, non-stick coating that has enhanced bonding over traditional Teflon coating. Summit ESP DuraHard® 3 coating reduces friction on running surfaces, which minimizes the formation of scale and pump plugging.

Suitable for application in:
- Wellbore fluids with scaling and/or asphaltene tendencies
- Temperature resistant up to 500°F (260°C)

Turnaround: 2-5 days

DuraHard® 7 Coating
Enhanced Abrasion and Corrosion Resistance
Summit ESP DuraHard® 7 high-phosphorous nickel coating provides additional, non-molecular surface hardness to stage materials (impeller and diffuser surfaces). Heat treatment provides uniform coating to all surfaces. DuraHard 7 coating is recommended in applications with a significant presence of heat, abrasives, and/or corrosion. An analysis of well fluid or sand particles is recommended to determine the ideal solution.

Suitable for application in:
- Corrosive environments
- Recently fractured wells with uniform sand particles
- Cased-hole applications where sand control is not 100 percent effective
- Temperature resistant up to 500°F (260°C)

Turnaround: 2-5 days

DuraHard® 15 Coating
Extreme Abrasion and Corrosion Resistance
The Summit ESP premium DuraHard® 15 molecular bond coating provides hardness comparable to carbide materials, but has added ductility and can be used to coat and bond steel components. DuraHard 15 coating is recommended in applications with a severe presence of heat, abrasives, and/or corrosion. An analysis of well fluid or sand particles is recommended to determine the ideal solution.

Suitable for application in:
- Highly corrosive well fluids
- Recently fractured wells with uniform or non-uniform sand particles
- Wells with very high angular abrasive sand and formation fines
- Wells with quartz sand
- Openhole wells or wellbores with no sand control
- Temperature resistant to over 500°F (260°C)

Turnaround: 2 weeks

DuraHard® 30 Coating
Superior Abrasion and Corrosion Resistance
Summit ESP DuraHard® 30 coating provides an enhanced bond over Teflon and similar coatings. It is recommended for applications with severe friction, abrasive wear, and/or corrosion. An analysis of well fluid or sand particles is recommended to determine the ideal solution.

Suitable for application in:
- Severe friction or wear environments
- Corrosive environments, particularly in the presence of heat and high water content
- Temperature resistant up to 500°F (260°C)

Turnaround: 2-5 days

DuraHard® 45 Coating
Ultimate Abrasion and Corrosion Resistance
Summit ESP DuraHard® 45 coating provides the highest molecular bond coating hardness and molecular surface hardness available. It is recommended for applications with extreme friction, abrasive wear, and/or corrosion. An analysis of well fluid or sand particles is recommended to determine the ideal solution.

Suitable for application in:
- Severe friction or wear environments
- Corrosive environments, particularly in the presence of heat and high water content
- Temperature resistant up to 500°F (260°C)

Turnaround: 2-5 days

DuraHard® 60 Coating
Maximum Abrasion and Corrosion Resistance
Summit ESP DuraHard® 60 coating provides an enhanced bond over Teflon and similar coatings. It is recommended for applications with severe friction, abrasive wear, and/or corrosion. An analysis of well fluid or sand particles is recommended to determine the ideal solution.

Suitable for application in:
- Severe friction or wear environments
- Corrosive environments, particularly in the presence of heat and high water content
- Temperature resistant up to 500°F (260°C)

Turnaround: 2-5 days

Avenger® Motor Lead Extension

OUTPERFORMS IN CORROSIVE HIGH-TEMPERATURE ACCELERATED LIFE TESTS

Overview
A weak point in the electric submersible pump’s (ESP’s) electrical system is the pothead electrical connection (also known as the motor lead extension or MLE) because it is required to act as both an electrical connector and a seal to the motor. Additionally, high wellbore temperatures and the heat generated from the motor can lead to premature motor failure.

Summit ESP engineers have developed the Avenger™ MLE as a cost-effective solution that is reliable in both high-temperature and gassy wells. To prove the design and pinpoint any deficiencies, the Avenger MLE has been run through a number of accelerated life test protocols (ALTPs), which were created in partnership with some of our customers. These tests were performed at our research and development facility. Using a pressure vessel with 4,000 psi of carbon dioxide (CO₂) and nitrogen, a mixture of water and diesel fuel to simulate well fluids, and with temperatures cycled up to 500°F (260°C) for seven days, engineers tested both our legacy and Avenger MLE designs, as well as two other competitor potheads.

When the testing was completed, two fatal flaws were noted on the competitors’ MLEs related to the internal rubber seal swelling because of thermal expansion and the impregnation of gases. Both flaws resulted in an electrical failure of the competitors’ ESP, while the Avenger MLE was still functioning perfectly.

Features
- Sealed internally, using an O-ring within the motor head to protect the seal
- Protection against corrosive gases provided by a lead washer seated in a groove on the face of the pothead
- Rubber component in the seal reduced by 90 percent to mitigate swelling issues
- Surpasses the industry in thermal ratings up to 450°F bottomhole temperature (BHT)
- 24-hour availability of any length MLE due to rapid assembly, which is conducted in half the time of competitor MLEs
- Historically proven tape-in connection creates a 260 percent longer arc path than is typical of the industry
- Made in the U.S.
High Performance Cables

COMPLETE LINE OF TECHNICALLY ADVANCED CABLES

Summit ESP® – A Halliburton Service provides a complete line of high performance cables designed to the exact standards required for electric submersible pump (ESP) systems. To maximize operational longevity, all Summit ESP cables are tested to the latest API and IEEE recommended practices, as well as to the stringent Summit ESP specifications for each specific line.

The Summit ESP EPDM (ethylene propylene diene monomer) cable uses an insulation compound specially formulated to be oil-resistant while maintaining excellent electrical properties. For additional protection, a lead jacket or an additional EPDM jacket is applied over the insulation to add strength and provide an added shield to the insulation.

SELF cable: The workhorse of the cable product line is the SELF (Summit EPDM Lead Flat) cable. SELF cable is designed to operate over a wide temperature range from –40°F (–40°C) to 450°F (232°C). A corrosive-resistant lead sheath is extruded over the insulation, making the cable impervious to gas or chemical penetration. This lead jacket barrier protects the insulation in wells that have hot and gassy conditions, and is the only true protection against gas decompression, which commonly occurs within the cable when gas is present. The cable is designed for environments where H₂S is greater than 3 percent or where CO₂ content is high.

SELR cable: The SELR (Summit EPDM Lead Round) cable uses an EPDM insulation and lead jacket over each phase. The phase wires are then twisted together, and an EPDM jacket is extruded over all three phases in a round configuration. This cable is designed to operate in a range from –40°F (–40°C) to 450°F (232°C) in environments where H₂S is greater than 3 percent or where CO₂ content is high.

SEER cable: The SEER (Summit EPDM EPDM Round) cable uses an EPDM insulation and EPDM jacket in a round configuration. The three-conductor cables are designed to operate in a range from –60°F (–51°C) to 400°F (204°C). SEER cable is the right selection for hot wells that do not have issues with sour gas or gas decompression, which commonly occurs within the cable when gas is present.

SENF and SENR cables: The SENF (Summit EPDM Nitrile Flat) cable and SENR (Summit EPDM Nitrile Round) cable utilize a specially formulated low-swell nitrile jacket to protect the EPDM insulation from downhole environments. SENF and SENR cables are designed to operate from –30°F (–34°C) to 280°F (137°C) in operations with less than 10 percent CO₂ and H₂S concentrations below 2.5 percent.

Summit ESP also offers polypropylene insulated cables with options of both lead and nitrile jackets. The Summit ESP polypropylene-insulated cable product line uses a thermoplastic compound that delivers excellent electrical properties and operates best in wells with cooler downhole temperatures.

SPLF cable: The Summit ESP SPLF (Summit Polypropylene Lead Flat) cable utilizes a corrosive-resistant lead sheath extruded over the polypropylene insulation, making the cable impervious to gas or chemical penetration. This lead jacket barrier protects the insulation in wells that have gassy conditions, and is the only true protection against gas decompression within the cable.

SPLF cables are designed to operate in a temperature range from –40°F (–40°C) to 250°F (121°C) and in environments where H₂S is greater than 3 percent or where CO₂ content is high.

SPNF and SPNR cables: The Summit ESP SPNF (Summit Polypropylene Nitrile Flat) cable and SPNR (Summit Polypropylene Nitrile Round) cable utilize a specially formulated low-swell nitrile jacket to protect the polypropylene insulation from downhole environments. SPNF and SPNR cables are designed to operate in a temperature range from –30°F (–34°C) to 205°F (96°C) and for operations with less than 10 percent CO₂ and H₂S concentrations below 2.5 percent.

Features
- Industry-standard, solid-copper conductor
- Superior insulation compounds for all cables
- Robust lead sheath for extreme well conditions
- Armor offered in galvanized steel, 316L stainless steel, and MONEL® nickel-copper alloy
- Optional capillary tubes for chemical treatment
- All standard cables are 5-KV rated
- Superior insulation compounds
- All standard cables are 5-KV rated
- More decompression resistant
- Insulation and jackets compounded for longer life
- Lead sheath impervious to fluid and gas intrusion
- Armor profiled for maximum protection
- Round cables are phase identified for easy installation
- Extended operational life

Benefits

MONEL® is a trademark of the Special Metals Corporation group of companies.
SandRight® Solids Fallback Preventer

SAND MANAGEMENT TOOL

Overview
The SandRight® solids fallback preventer deters damaging solids from entering the electric submersible pump (ESP) during power shutdown events. Its unique design features preserve the ESP especially in wells subject to dislodged formation and frac sands. Unlike other solutions in the industry, it maintains the ability to execute through-tubing chemical treatments while also resisting paraffin/scale buildup by using superior materials.

How It Works
When an ESP is shutdown, solids hovering in the production tubing above the ESP are a major issue, especially in unconventional applications. These solids fall back to the ESP pumps and become lodged in the pumps’ stages. Restart attempts can overstress motors, accelerate pump wear, overheat cable and/or result in catastrophic failure. The SandRight tool not only protects ESP pumps from permanent damage due to solids fallback, but also significantly increases an ESP’s runtime in unconventional applications.

Advantages
The SandRight tool is compact, is easily deployed, and out-performs all other solutions on the market. Its unique sand fallback prevention capabilities address all known issues with most fallback preventers – such as erosion/corrosion, paraffin buildup, incompatibility with desanders, and jamming issues – while retaining the ability to perform through-tubing chemical treatments. Specifically, it helps:

- Achieve economical ESP run-times in applications with sand issues
- Decrease total number of hard start events
- Decrease severity of hard start conditions (high current, rocking starts, etc.)
- Extend ESP runtime beyond what is capable with using other sand management tools/techniques
- Eliminate premature ESP failures when integrated into a total solution (including desander, tubing and casing transducers, and Summit ESP® Well Surveillance and Monitoring Service)
- Integrate faster and easier into the ESP system

Features
- Plate-flow design
- Directional and graduated passageways
- Hardened and corrosion-resistant metallurgy
- Inert coatings on all wetted surfaces
- Continuous fluid communication passageways

Benefits
- Stops sand from flowing in reverse direction
- Creates a ‘leak-off’ effect for wide range of sand concentration and flow rates
- Provides higher abrasion resistance for long wear
- Resists paraffin and scale build-up
- Supports gas management and through-tubing treatments

BASIC OPERATION:
1. Shutdown occurs and sand falls back towards the ESP.
2. Sand bridging forms in the SandRight tool, thereby restricting passage of sand.
3. Pumps are successfully restarted.
4. Sand column above the SandRight tool is re-fluidized and pushed/flowed toward the surface.

Field tests show continuous restarts with low stress on the electric submersible pump system.

Lab tests show sand fallback simulation and bridge forming validation.
Deviator™ Flange

INCREASED FLANGE CONNECTION STRENGTH FOR CHALLENGING WELL APPLICATIONS

Overview
Summit ESP® – A Halliburton Service is committed to reliability, flawless execution at the wellhead, and the lowest total operating cost. With this in mind, we have developed an innovative, value-added connection component to our electric submersible pump (ESP) system. This addition to the Halliburton product line is ideal for horizontal or deviated wells, and allows for installation into wells with significant doglegs. The Deviator™ flange offers solutions for greater recovery of reserves by setting the ESP closer to the pay zone.

Features
- Larger stainless steel cross-sectional area
- Armored cage-like configuration
- Double O-ring connection

Benefits
- Increased stiffness prevents permanent deformation
- Extended bars protect the cable
- Redundant sealing prevents leaking
- Resists paraffin and scale build-up
- Prevents tool from jamming
- Supports gas management and through-tubing treatments

System Benefits
- Improved durability in extreme operating environments
- Enhanced design for challenging well environments
- Strengthened ESP components for a more reliable, efficient, and durable production system

The Deviator™ flange design allows ESP systems to go deeper in the well and closer to the production zones, supporting stable well performance and lower operating cost. Utilizing high-strength materials enables installation into wells with dogleg severity (DLS) up to 18°/100 feet.
