**BaraMesh™ Shaker Screens Outlast Competitor’s Screens and Cut Costs by $7.5k per Well**

Location: South Texas, USA

**Operator’s Challenge**
The Baroid team working in South Texas was challenged to design and implement a solids control system that would reduce the operator’s overall shaker screen cost while minimizing the low gravity solids (LGS) concentration in the drilling fluid.

**Halliburton’s Solution**
The 170-mesh BaraMesh™ screens successfully outperformed the competitor’s screens by decreasing the LGS content in the active drilling fluid. Correspondingly improving drilling fluid performance and lowering overall well costs. The BaraMesh screens lasted twice as long as the competitor’s screens, yielding a large end of well savings.

**Economic Value Created**
The operator was able to drill the well with 50% fewer screen replacements when using the BaraMesh screens. The average cost reduction per well is $7,575.

The unique rectangular BaraMesh screen design offers an approximate 1.6:1 aspect ratio. As a consequence this improves fluid conductivity and screen life when compared to the equivalent 1:1 square.
