Cementing

Stabilizer 434B
Latex Stabilizer

Stabilizer 434B latex stabilizer is a liquid material used with Latex 2000 cement to stabilize the latex in the cement slurry. Latex 2000 cement is a polymer emulsion and in the presence of salts, particularly divalent ions such as calcium, the latex tends to come out of emulsion, losing its effectiveness against gas migration in cement slurries. Stabilizer 434B latex stabilizer helps prevent the de-emulsification of Latex 2000 additive in cement slurries.

Features
Stabilizer 434B latex stabilizer is a translucent liquid additive that can be applied at temperatures from 80°F to 320°F (27°C to 160°C). Stabilizer 434B latex stabilizer was developed specifically for use with Latex 2000 cement, in conjunction with defoamer.

Benefits
Stabilizer 434B latex stabilizer has the following benefits:
- It helps stabilize latex cement to keep it in emulsion.
- It is applicable over a wide temperature range.
