

Swellpacker® Systems Help Save \$3 Million by Reducing Rig Time

HALLIBURTON ENABLES GREATER PRODUCTIVITY IN DEVELOPMENT WELLS, HELPING TO DECREASE COMPLETION TIME BY 10 DAYS

DEEPWATER LATIN AMERICA

CHALLENGES

Operator wanted to reduce completion time and increase reservoir contact.

- » Increase operational efficiency of development program
- » Highly depressurized zone
- » Reduced hole sizes

SOLUTIONS

Swellpacker® systems in conjunction with VersaFlex® liner hangers were run in the well.

- » Multiple Swellpacker systems run for reservoir management
- » Zonal isolation was verified using a SpectraScan® log

RESULTS

Halliburton reduced completion time by 10 days.

- » Estimated \$3 million in rig savings
- » Minimized risk
- » Increased production due to greater reservoir contact
- » No HSE incidents or NPT during the completion

OVERVIEW

An operator was trying to complete highly depressurized zones in its deepwater wells offshore Latin America. While this is a challenge in itself, the operator also wanted to reduce completion times and increase contact with the reservoir. Halliburton proposed a joint solution that utilized VersaFlex® expandable liner hangers and Swellpacker® isolation systems. This design not only saved 10 days of completion time and the associated cost, but also reduced risk and increased production, resulting in additional value for the operator.

CHALLENGE

During development drilling, a major Latin America operator wished to reduce its well completion times, increase contact with the reservoir to enable greater productivity from the well, and decrease the risk associated with conventional well completions. The wells are producing from a highly depressurized zone, and therefore must be completed using reduced hole sizes.

SOLUTION

After Halliburton considered the operator's operational requirements and consulted with its engineering team, it was decided that the operator's field wells could be more efficiently completed using Swellpacker systems in conjunction with slotted liners. The Halliburton team recommended running VersaFlex liner hangers with 5-inch Swellpacker systems to compartmentalize the slotted liner in different zones, helping eliminate the risk of losing cement to the formation.

Compartmentalization of the producing formation would allow the operator to better manage well productivity should water coning occur, thereby increasing the life-of-the-well. The VersaFlex liner hangers and Swellpacker systems run in the wellbore support life of the well isolation, enabling the above goal to become a reality.

The Swellpacker systems were run into the well for a distance of more than 370 meters (1,214 feet) inside the open hole, during which they performed flawlessly and did not encounter any dragging or restriction issues. Once the Swellpacker systems had fully set, zonal isolation was verified using a SpectraScan® log to ensure the packers had swelled to the open hole. The well was completed ahead of schedule and as expected, without incident or nonproductive time.

Using Swellpacker® isolation systems reduced the well completion time from 18 days to just eight days

RESULTS

The use of Halliburton Swellpacker isolation systems and VersaFlex liner hanger systems helped reduce both the well completion time and the risks associated with conventional well completions. Additionally, the Halliburton solution helped mitigate problems that can often be experienced during cementing operation in depleted formations. Increased production was achieved due to higher contact with the reservoir and effective reservoir management through superior zonal isolation. In this case, a greater area of the producing zone was exposed to production, which also reduced damage to the formation. Also, costs associated with cementing, perforating and cleaning were reduced. Completion time for the wells was decreased from 18 days to eight days which, in turn, resulted in additional savings for the operator.

Deploying VersaFlex® expandable liner hangers in conjunction with Swellpacker® isolation systems helped save 10 days of completion time and reduced risk.
