

SafeguardSM Service

SafeguardSM risk prevention service is based on API RP75. Its components can be applied at any phase of a project from conception to completion.

Undoubtedly, we accept risk, at some level, on a daily basis. To achieve operational excellence, risk assessment, subsequent management, and ultimately the mitigation of risks must be a conscious process employed by all, as it will determine the success of our endeavors.

Risk mitigation only occurs when effective controls have been developed, implemented, and verified. A Blowout Contingency Plan (BCP) / Well Control Contingency Plan (WCCP) can easily be rendered ineffective if the drilling program changes and the WCCP is not subjected to Management of Change processes and updated to reflect those changes.

True integration requires a partnership between involved parties, a partnership where the actions of the contractor are transparent, and the ultimate goal is for the contractor to provide a true value-added service. Boots & Coots Prevention Services offers the most complete risk management and mitigation package available in the industry today. We understand the work, we understand the exposure, and we offer value-added solutions.

Identification and management of risk is an important aspect of business management in today's competitive world. It is even more relevant when we talk about the oil and gas exploration and production.

Areas Addressed

Our Safeguard risk prevention services are customized based on your needs. These may include training, risk analysis, contingency planning, audit programs, deepwater application and well inspections, as well as blowout prevention and control counsel or assistance in addressing identified risks.

Risk Management – A Systematic and Continuous Process

With our Safeguard service, you can reduce the likelihood and consequences of accidents and help ensure the integrity of your facilities, improve productivity and protect your assets, your employees and the public.

Before you run into a problem, be prepared by calling Boots & Coots to help you understand your risks, reduce the potential for a catastrophe, and mitigate damages in the event a loss occurs. By implementing a systematic, continuous risk management process, you can help ensure that risks are identified, evaluated, monitored, and controlled over the life of the well.
